

What is claimed is:

1. A method of creating an on-line interface, comprising:  
gathering information from customers off-line; and  
creating an on-line store based on the gathered information, such that on-line users can access the gathered information and inquire about the information to the off-line customers.
2. The method of claim 1, further comprising:  
storing information gathered from the off-line customers in a storage device;  
uploading the gathered information to a server located on a network and accessible on-line; and  
monitoring the on-line store on behalf of the off-line customers.
3. The method of claim 2, wherein the gathering is performed by a sales person/consultant.
4. A computer readable medium storing a program, the program comprising:  
gathering information from customers off-line; and  
creating an on-line store based on the gathered information, such that on-line users can access the gathered information and inquire about the information to the off-line customers.
5. The program of claim 4, further comprising:  
storing information gathered from the off-line customers in a storage device;  
uploading the gathered information to a server located on a network and accessible on-line; and  
monitoring the on-line store on behalf of the off-line customers.

6. A method of gathering data from off-line users and transmitting the data over a transmission medium to on-line users, comprising:

downloading the data from a storage device to a server; and  
providing access to the data from the server to a third device, such that the on-line users can view the data gathered off-line.

7. The method of claim 6, further comprising:

sending the data from the server to the third device; and  
receiving a response from the third device based on the sent data.

8. A system for bringing users without on-line capability on-line, comprising:

a computer gathering information about the user;  
a server storing the information gathered by the computer; and  
a client accessing the information on the server in order to create an on-line site, such that the site can be accessed by on-line users.

9. A method of monitoring an on-line site for off-line user, comprising:  
monitoring the on-line site to determine whether the site has been accessed and whether a request for information has been made by an on-line user of the site; and  
forwarding a copy of the request to the off-line user corresponding to the on-line site via a transmission medium that does not require on-line access.

10. The method of claim 9, further comprising:  
receiving a response from the off-line user about the request; and  
updating the on-line site to reflect the response received by the off-line user.
